WAR'S ON THE WIRES, TOO

Long distance calls must be handled over wires already overloaded with war calls—calls to help speed the training of men and the flow of ships, guns, planes and other weapons—calls from thousands of service men and women to their homes and relatives.

We are doing our best to handle every call as quickly as possible. To make delays as few and as brief as possible, we re-arrange long distance telephone circuits every night and on week-ends, to make as many lines as can be spared available to you. Despite everything we can do, however, at times there just aren't enough lines to handle all the calls without delay.

Ordinarily we would build more lines, enough to take care of everybody. But we can't do that in wartime. The materials we would need—the copper, the rubber, the aluminum—are being used to carry the war to the enemy. They are being used also to build telephone systems for hundreds of training stations, camps and bases, and in adding to central offices to serve these naval and military establishments.

Because you and hundreds of thousands of service men and women away from home are all sharing the same lines, we hope you will make your calls as brief as possible. The sooner you leave the booth the sooner those waiting behind you can get their calls through. By limiting your call—to five minutes, say—you can help make room on crowded wires for calls that might not otherwise get through.
